

Your questions answered

Your local approved contractor

Q Is there a guarantee?

A Yes – 15 years. The material will actually last in excess of 25 years.

Q Why insulate a flat roof?

A A majority of existing flat roofs only have 20-50mm of insulation (excluding garages) but all new flat roofs now need to have at least 90mm of insulation installed. Thicker insulation will not only help the environment by reducing your CO2 emissions but it will also save you money on your heating bills. Depending on the roof type your pay back period could be a little as 4 years.

Q What other weather proofing systems are there and why should I choose single ply?

A In the past the only flat roofing product available was bituminous felt roofing. There have been huge advances made in roofing technology over the last few decades. Single ply is by far the most widely used flat roofing waterproofing system in the new building sector today. Only in recent years has it become available to the domestic and refurbishment market.

Q Who will install my new roof?

A Interloc is the supplier of the Envirotech EVA single ply membrane. We work with different roofing contractors throughout the UK which have been trained and approved by Interloc. Only roofing contractors that have high workmanship standards can become approved contractors.

Q How much will it cost?

A Envirotech EVA single ply membrane is a competitively priced waterproofing system. The actual price of your roof will of course be influenced by how complicated the roofing details are, however the product is very competitive compared to other quality waterproofing systems. Please contact your local approved installer for specific costings.
